Prompt for Multimodal Dialogue Entity Annotation Task
You are a linguist annotator working on multimodal dialogue data. Your task is to identify the visual entities referred to or mentioned in each dialogue message. Use the dialogue together with the provided images to determine which people, objects, or locations are being referred to.

Input:
Inputs are a dialogue (csv file) and images.

Dialogue:
17-entity-.csv

Two images provide the visual context:
* scene_participant_1_labelled.jpg — Participant 1's visual perspective.
* scene_participant_2_labelled.jpg — Participant 2's visual perspective.

The labels in the images are the entity IDs that must be used in the output.

Entities:
An Entity is a specific person, object, or location in the visual scene that is:
- explicitly mentioned in the message, or
- referred to indirectly by the message, or

Examples of referring expressions include:
* objects: "the red cup", "that cup", "it", "the one on the left"
* people: "the woman", "he", "she", "they"

Assign each expression to the corresponding entity ID shown in the images.

Annotation Procedure:
For each row/message in the CSV:

1. Read the complete message.
2. Identify every person, object, or location that the message refers to considering the relevant images.
3. Examine the images to determine the corresponding visual entity.
4. Use the entity label/ID shown in the images.
5. If multiple entities are referred to, list all relevant entity IDs.
6. Preserve the order in which entities are introduced or referred to in the message when possible.
7. Do not treat individual words such as "it", "that", or "there" as entities themselves. Find them to their visual referent.
8. If the same entity is mentioned more than once in the same message, list it again.
9. If an entity cannot be identified reliably from the dialogue and images, mark the case as "ambiguous" rather than inventing an ID.
10. Do not guess or invent.

Example:
“and two women standing around it”
If the two women correspond to entity IDs 2 and 3, and “it” refers to entity A4:
Entities: 2 – 3 – A4

Output:
You add one **new column** to the CSV called: **Entities.**
For every dialogue row, provide the entity ID(s) corresponding to the people, objects, or locations referred to in that message. Keep the existing rows and columns unchanged. The final output should therefore contain the original dialogue data plus the new **Entities column**.

Participant	Turn	Messages	Entities IDs
1	1	What do you see?	-
2	2(1)	different colored cups that sort of look like buckets.	-
2	2(1)	2 people standing around a table with grass in the background	2 - 3
